

Machine learning for early cardiovascular risk prediction in primary care

Sara Ahmed, John Smith and Layla Hassan
Department of Cardiology, Example University, Cairo, Egypt

Abstract

Background: Risk scores underperform in young adults. Methods: We trained gradient boosting on 12,000 records. Results: AUC reached 0.87. Conclusions: ML improves early identification.

Keywords: cardiology, machine learning, risk prediction

1. Introduction

[illegible][illegible]

2. Methods

Study design

[illegible]

3. Results

Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Table 1 shows the cohort.

4. Discussion

Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care.

5. Conclusion

Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care. Cardiovascular disease remains a leading cause of death worldwide, and early risk stratification can improve outcomes in primary care.
